Operational Technology Innovation

The LEGO Group

Billund, Denmark

Application: OT Automation Engineer (Req. 0000038614)

Dear Hiring Team,

I am applying for the OT Automation Engineer role in Operational Technology Innovation. I am an automation and robotics engineer with an MTech in Mechatronics, finishing my PhD at Aalborg University, and what I enjoy most is exactly what this role describes: taking an idea through feasibility and proof-of-concept to a prototype that works.

In my PhD, I took a hybrid-actuated shoulder exoskeleton from concept to tested hardware, combining a parallel spring with a small motor. I designed and built the prototype, integrated the motor, encoder, force sensors, DAQ and embedded control, and built custom test rigs. The concept cut energy use by more than 25% and won the Best Paper Award at IFToMM ISRM 2026.

I like comparing technical options on evidence. On a 5-bar planar parallel robot, I estimated the end-effector force from variable-stiffness actuators through the robot's Jacobian and validated it against a force sensor to within 10% RMS error. During my Master's at CSIR-CMERI, I built pneumatic actuators and a pneumatic test set-up, and developed a controller that reduced tracking error to below 0.8%.

I communicate well with different audiences. I have taught and supervised Bachelor's students, published peer-reviewed work, and worked in international teams in India and Denmark in English.

My automation experience so far is in research labs rather than factory environments, and I have not yet programmed industrial PLCs. My controls background in embedded control, LabVIEW and pneumatics gives me a solid base, and I am ready to build PLC skills quickly in a team that is shaping LEGO's future factories.

I would welcome the opportunity to discuss how I can contribute. References are available upon request.

Kind regards,

Arunabha Majumder
