TETMET, Paris (La Défense)

Application: Application Engineer

Dear TETMET team,

I am applying for the Application Engineer role in Paris. I am a mechanical and mechatronics engineer doing my PhD at Aalborg University, with my thesis expected to be finished in March. Lattice structures caught my attention because they sit right where I like to work: designing a light structure, printing it, and then finding out on a real test setup whether it behaves the way you planned.

In my PhD I designed a hybrid shoulder exoskeleton that has to be light and stiff at the same time, because a person wears it. I modelled it in SolidWorks, optimised the design with a genetic algorithm, 3D printed and rebuilt the parts many times, and measured the stiffness it provides on a physical test setup. It cut energy use by more than 25% and won the Best Paper Award at IFToMM ISRM 2026. I also designed and modelled a novel 5-bar planar parallel robot with variable stiffness mechanisms, estimated its stiffness with less than 10% error and quantified human arm impedance. I have also done stiffness analysis in SolidWorks, and I use MATLAB and basic Python for data and calculations.

I want to be honest about the gaps. I do not have 5 years in industry, and I have not used ANSYS Workbench, LS-DYNA or Rhino/Grasshopper yet. What I bring is a solid base in stiffness, optimisation and physical testing, and a lot of hands-on 3D printing. I also hold a Diploma in Fine Arts, so I explain designs clearly to clients with sketches. I learn new tools quickly, and I would be glad to grow into simulation work in your team.

Thank you for considering my application. You can see my work at arunabha22.github.io/arunabha-majumder.

Kind regards,
Arunabha Majumder
