Quality Assurance, Danfoss Power Solutions
Nordborg, Denmark

Application: Test Engineer (f/m/d)

Dear Hiring Team,

I am applying for the Test Engineer position in Quality Assurance at Danfoss Power Solutions. I am a mechatronics engineer finishing my PhD at Aalborg University, and what I enjoy most in my work is exactly what this role is about: testing systems in the lab, finding out why they do not behave as expected, and proving that a solution works.

In my PhD, I built, instrumented and tested a hybrid-actuated shoulder exoskeleton that combines mechanics, electronics and embedded control. Through repeated test campaigns, I troubleshoot and fixed issues across the mechanical interfaces, motor, encoder, force sensors and DAQ. On a 5-bar planar parallel robot, I validated a sensorless force-estimation method against a reference force sensor to within 10% RMS error. I design my own test rigs, and I ran the data collection for a 12-participant study across several operating modes and load conditions.

I work in a structured way and communicate well across disciplines. My projects have involved mechanical, electronics, control and biomechanics specialists, and I have supervised Bachelor's students and documented my results in peer-reviewed publications.

I want to be open about where I would grow. My electronics experience comes from integrating motors, sensors and data acquisition rather than detailed circuit analysis, and I have not yet worked with failure analysis of returned customer products. I learn quickly and would value building this expertise in your team, including through the onboarding training in Minneapolis.

I would welcome the opportunity to discuss how I can contribute to Danfoss. References are available upon request.

Kind regards,
Arunabha Majumder
