REVEL, Design team, Prague

Application: Industrial Design CAD Engineer

Dear REVEL Design Team,

I am applying for the Industrial Design CAD Engineer role. I like work where the look of a product and the way it is built have to agree, and your Neural Gambit wearable is close to what I have spent my PhD on at Aalborg University: hardware that sits on a human body.

My main project was a hybrid shoulder exoskeleton. I took it from sketches to a full parametric CAD assembly in SolidWorks: the mechanism, the mounting points, the fasteners and the clearances around the moving joints. I integrated a 6 Nm motor, an encoder and torque/force sensors into it. I 3D printed the parts, assembled them, checked the fit on the real prototype and refined the CAD before the final parts were manufactured. It uses more than 25% less motor energy and won the Best Paper Award at IFToMM ISRM 2026.

One lesson stayed with me. My first clutch kept breaking and was hard to make in our workshop, so I replaced it with a simple bolt-locking clutch that still locks at 8 angles and is easy to fit and replace. Since then I think about assembly and maintenance from the first sketch.

I also have a Senior Diploma in Fine Arts (Painting), and I do graphic design and illustration in Adobe Illustrator, Photoshop and Procreate. I sketch concepts by hand before I open CAD, which helps me talk with product designers and keep their design intent when I build the parts underneath the surfaces.

To be honest about the gaps: my main parametric CAD is SolidWorks. I used Fusion 360 a little, last in 2019, and never professionally. My 3+ years are in research and teaching, not in a company. The way of working is the same, and I can get back up to speed in Fusion quickly. My portfolio shows the parts and prototypes and what I did on each. My research is finished, so I can start soon, and I am happy to move to Prague. Thank you for reading.

Kind regards,
Arunabha Majumder
